JOB MARKET PAPER

- **Who Governs the Forest? Politician Identity and Forest Conservation**
  Using a staggered difference-in-differences design and satellite-derived forest cover data, I show that indigenous political representation increases local forest cover, with effects concentrated near mining sites and in sparsely forested areas. Political quotas for indigenous communities disrupt the political equilibrium, bringing younger, more female winners into office through more competitive elections. Conservation gains do not erode even after electoral quotas for indigenous communities are withdrawn, indicating durable changes in local governance rather than effects tied mechanically to the quota.
